

InfraCrease+™

Permanent deformation for PP-materials

For the ARISTOMAT GL and TL series the InfraCrease+ system for permanent deformation of pp-materials is also now available.

Software-driven change of direction of the light source.

Permanent deformation by well-aimed cone of light.

The new intelligent InfraCrease+™ for the MultiHead IV now makes it possible to crease cartonplast in x- and y-direction.

The software-driven light head is turned to the corresponding direction during the creasing process.

A strong, well-aimed beam warms the material during creasing and so creates a permanent deformation. This enables Cartonplast to be creased and cut without any problems.
